

ABSTRACT OF THE DISCLOSURE

A radio switching system includes a mobile subscriber;  
a base station controller for controlling a transmission and  
5 reception of a signal of the mobile subscriber within an own  
cell; a mobile switching center connecting with a plurality of  
the base station controllers; and a home location register for  
storing home zone information whether or not the mobile  
subscriber is a subscriber of home zone services. The mobile  
10 switching center judges whether or not a registration is  
accepted with respect to a location registration request  
inside/outside a home zone of the mobile subscriber, based on  
home zone information sent from the home location register.
